

Phase 7 – External System Integration (Inbound & Outbound)

Objective

- Configure Salesforce to **send data to an external system** (outbound).
- Configure Salesforce to **receive data from an external system** (inbound).
- Log all requests and responses for audit purposes.

◆ Step 1: Create Named Credential

1. Go to **Setup → Named Credentials → New**.
2. Enter details like:
 - Label = LabAPI_Test
 - Name = LabAPI_Test
 - URL = External API base URL
 - Authentication = None
3. Save.

Screenshot 1:

The screenshot shows the Salesforce Setup interface for Named Credentials. The left sidebar shows the navigation menu with 'Setup' selected. The main content area is titled 'Named Credentials' and shows a table with 2 items. The table columns are Label, Type, URL, External Credential, and Actions. The items listed are LabAPI_Cred and LabAPI_Test, both of type Secured Endpoint and URL https://reqres.in/api. The External Credential for LabAPI_Cred is LabAPI_External and for LabAPI_Test is LabAPI_Test_External.

Label	Type	URL	External Credential	Actions
LabAPI_Cred	Secured Endpoint	https://reqres.in/api	LabAPI_External	
LabAPI_Test	Secured Endpoint	https://reqres.in/api	LabAPI_Test_External	

◆ Step 2: Outbound Integration (Send Data)

1. Create a new Apex Class to handle outbound requests.
2. Configure it to use the Named Credential.
3. Log each request and response in a custom object.

◆ Step 3: Inbound Integration (Receive Data)

1. Create a new Apex REST class.
2. Define:

- **POST** → To accept data from external system and save it in Salesforce.
 - **GET** → To retrieve stored results from Salesforce.
3. Ensure response is returned in JSON format.

📌 **Screenshot 4:**

◆ **Step 5: Test Outbound (Workbench)**

1. Open **Workbench** → **Utilities** → **Apex Execute**.
2. Call the outbound class to send a test request.
3. Check:
 - Debug Logs → Response details.
 - Integration_Log records → Request & Response saved.

◆ **Step 6: Test Inbound (Workbench REST Explorer)**

1. Go to **Workbench** → **REST Explorer**.
2. Choose **POST** method.
3. Enter endpoint: `/services/apexrest/labresults/`.
4. Send sample JSON body.
5. Verify response message (status: success) and saved record.
6. Choose **GET** method on the same endpoint to fetch results.

7.

◆ Step 7: Debug Logs

1. Go to **Setup → Debug Logs**.
2. Add a trace flag for your user.
3. Re-run inbound and outbound tests.
4. Check logs to confirm transactions and errors.

✳ Screenshot 10:

User	Application	Operation	Time	Status	Read	Size
Shaik Jasmin	Unknown	/labresults/	26/09/2025, 00:14:26	Success	Unread	34.88 KB

✓ At the end of Phase 7:

- Outbound integration works (Salesforce sends data).
- Inbound integration works (Salesforce receives data).
